

ASSET WALKTHROUGH TEMPLATE

30-Minute Physical Inventory for Visibility & Risk Awareness
#AssetHunt Edition | Created by Djerhy Jn Baptiste (djerhy.tech)

STEP 1: WALK YOUR SPACE

Look everywhere:

- Desks, closets, drawers, shelves
- Storage bins, cable piles, under tables
- Server racks, unused corners

Photo everything. Dust and cables = clues.

STEP 2: LOG WHAT YOU FIND

Log device details like name, type, and location in an **Excel or Google Sheets template**.

ASK AROUND

Quick checks to confirm:

- “Do you still use this?”
- “Can we retire it?”
- “Who owns it?”
- “What happens if it’s unplugged?”

Many ghost devices started as “just temporary.”

SPOT THE RISKS

Look for red flags:

- Unknown owners
 - Unsupported OS
 - No recent updates
 - Offline but still plugged in
 - Devices not listed anywhere
- not list = not protected

ACT

Use your notes to:

- Update your CMDB or asset tracker
- Plan patching or decommissioning
- Assign ownership
- Flag shadow IT
- Log this as hands-on experience

WHAT YOU JUST DISCOVERED:

If your walkthrough revealed:

- 3+ assets with unknown owners
- 1+ production system labeled "test" or "dev"
- Any asset you "can't turn off because we're not sure"

You don't have an inventory problem. You have an authority problem.
Next Step:

Run the complete 30-Day Authority Sprint to fix this systematically. → [Get Address The Mess - \$9.99 at djerhy.tech/resources]
